Catppuccin for Typst

Soothing pastel theme for Typst

v0.1.0 August 18, 2024

https://github.com/catppuccin/typst

TimeTravelPenguin

Abstract

The **catppuccin** package provides colourful Catppuccin asthetics for Typst documents. It provides four soothing pastel themes that is easy on the eyes. This manual provides a detailed documentation of the package.

THIS MANUAL IS CURRENTLY A WORK IN PROGRESS.

Contents

1. Overview

1.1. About

This document provides a detailed documentation of the **catppuccin** package for Typst. Inspired by the LaTeX Catppuccin package, this package hopes to make writing in Typst more pleasurable and easy to use.

As someone who has done a lot of LaTeX, I found myself spending a lot of time writing in dark themes (usually by inverting the document colors). Eventually I found the Catppuccin package for LaTeX, and I incorperated it into my custom preable to allow me to enable, disable, or configure the enabled theme. When I finished, I would submit my work with the theme disabled, without explicitly removing code!

I have plans for the future of this package, such as added styling and perhaps integration with other packages (if that ever becomes easier to do without making a new package).

1.2. Basic Usage

Using this package is simple. See Listing 1 for an example of how to use the package.

```
#import "catppuccin.typ": catppuccin, themes

#show: catppuccin.with(
  flavor: themes.mocha,
  code_block: true,
  code_syntax: true,
)

// The rest of your document
```

Listing 1: Example usage of the Catppuccin package

You can disable the theme by commenting out or deleting the show block. Just note that if you are manually accessing palettes via the `get-palette(flavor)` function, you will need to manually account for those changes. It is planned to make this easier in the future be it though a redesign or simple helper functions.

2. Modules

2.1. Catppuccin

- catppuccin()
- get_palette()

Variables:

- themes

2.1.1. catppuccin

Configure your document to use a Catppuccin flavor.

Example:

```
#import "@preview/catppuccin": catppuccin, themes

#show: catppuccin.with(themes.mocha, code_block: true, code_syntax: true)
```

This should be used at the top of your document.

Parameters

```
catppuccin(
  theme: string,
  code_block: boolean,
  code_syntax: boolean,
  body: content
) -> content
```

theme `string`

The flavor to set.

code_block `boolean`

Whether to styalise code blocks.

Default: `true`

code_syntax `boolean`

Whether to use Catppuccin syntax highlighting in code blocks.

Default: `true`

body `content`

The content to apply the flavor to.

2.1.2. get_palette

Get the color palette for the given theme. The returned dictionary has keys as defined in Flavor Schemas 3.1..

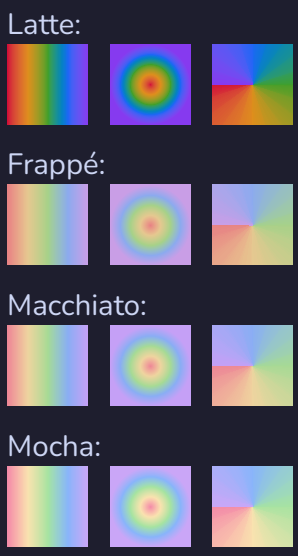
Example

```
#let items = themes.values().map(theme => [
  #let palette = get_palette(theme)
  #let rainbow = (
    "red", "yellow", "green",
    "blue", "mauve",
  ).map(c => palette.colors.at(c).rgb)

  #let fills = (
    gradient.linear(..rainbow),
    gradient.radial(..rainbow),
    gradient.conic(..rainbow),
  )

  #stack(
    dir: ttb,
    spacing: 4pt,
    text(palette.name + ":"),
    stack(
      dir: ltr,
      spacing: 3mm,
      ..fills.map(fill => square(fill: fill))
    )
  )
])

#grid(columns: 1, gutter: 1em, ..items)
```



Parameters

`get_palette(theme: string) -> dictionary`

theme `string`

The theme to get the palette for. The dict `themes` can be used to simplify this.

2.1.3. themes `dictionary`

The available flavors for Catppuccin. Given simply by the dictionary

```
#let themes = (
  latte: "latte",
  frappe: "frappe",
  macchiato: "macchiato",
  mocha: "mocha",
)
```

These names are used to set the theme of the document. To access the accented names, you can use `get_palette()` and access the `name` key.

3. Flavors

The Catppuccin package comes with four flavors: **Latte**, **Frappe**, **Macchiato**, and **Mocha**. Each flavor has its own unique color palette that is easy on the eyes. You can choose a flavor by setting the `flavor` parameter in the `catppuccin.with` function.

In this package, we refer to the dictionary related to each flavor with the type alias `flavor`.

3.1. Flavor Schema

Here we describe the schema for the `flavor` dictionary. Use *`get-palette()`* function to

- **name** `string` — The name of the flavor (e.g. Frappé)
- **emoji** `string` — The emoji associated with the flavor.
- **order** `integer` — The order of the flavor in the Catppuccin lineup.
- **dark** `boolean` — Whether the flavor is a dark theme.
- **light** `boolean` — Whether the flavor is a light theme.
- **colors** `dictionary` — A dictionary of colors used in the flavor. Keys are the color names as a `string` and values are dictionaries with the following keys:
  - **name** `string` — The name of the color.
  - **order** `integer` — The order of the color in the palette.
  - **hex** `string` — The hex value of the color.
  - **rgb** `string` — The RGB value of the color.
  - **accent** `boolean` — Whether the color is an accent color.

Variables:

- latte
- frappe
- macchiato
- mocha

3.1.1. latte `flavor`

The Latte color palette.

Example

```
#let theme = themes.latte
#let palette = get_palette(theme)
Selected theme: #palette.name #palette.emoji
```

Selected theme: Latte

3.1.2. frappe `flavor`

The Frappé color palette.

Example

```
#let theme = themes.frappe
#let palette = get_palette(theme)
Selected theme: #palette.name #palette.emoji
```

Selected theme: Frappé

3.1.3. macchiato `flavor`

The Macchiato color palette.

Example

```
#let theme = themes.macchiato
#let palette = get_palette(theme)
Selected theme: #palette.name #palette.emoji
```

Selected theme: Macchiato

3.1.4. mocha `flavor`

The Mocha color palette.

Example

```
#let theme = themes.mocha
#let palette = get_palette(theme)
Selected theme: #palette.name #palette.emoji
```

Selected theme: Mocha

3.2. Tidy Styles

- get_tidy_colors()

3.2.1. get_tidy_colors

A style thst can be used to generate documentation using Tidy for the Catppuccino theme. The returned dictionary is a tidy styles dictionary with some additional keys, most importantly `ctp_palette` whose value is the associated `flavor`.

Parameters

`get_tidy_colors(theme: string) -> dictionary`

theme `string`

The name of the theme to use.

Default: `themes.mocha`

3.3. Version

Variables:

- version

3.3.1. version `version`

The package version of Catppuccin.

Example:

```
This package's version is #version.
```

This package’s version is 0.1.0.
